

27 July 2026

To whom it may concern,

I am writing to recommend **Chhavi Tanwar**, who completed the **Future Founders Internship at OkCredit** in the summer of 2026 — an eight-week programme in which student teams find a real Indian merchant, uncover a problem worth solving in that merchant's business, and build and ship a working product until it is genuinely used. 756 teams from campuses across India began the programme. 66 finished it. Chhavi finished it.

Chhavi and her team tackled a real and unglamorous merchant pain: Attrey Misra at Amrit Mattha in Kanpur was running two entirely separate tracking systems — Paytm for digital payments, pen and paper for cash — with no unified view of his day. The team built a mobile-friendly web app from scratch: a tap-to-bill interface spanning twenty-two menu items, a cash/UPI toggle on every transaction, and a daily reconciliation dashboard that collapsed end-of-day bookkeeping into a single screen. Under the hood, confirmed orders synced automatically to a linked Google Sheet, and the app added PIN protection and an offline queue for unreliable connectivity. They corrected the menu in response to direct feedback from Attrey, worked through a failed solo-onboarding moment honestly, and ultimately captured four consecutive days of live transactional data — real usage from a real merchant.

What makes this worth a letter is the shape of the journey, not just where it ended. Chhavi began with open-ended discovery — interviewing working merchants in real shops; distilled what they heard into one merchant and one problem worth committing to; built from scratch and put the product into that merchant's hands; then iterated on live feedback until it was creating real, observable value in a running business. That is the complete founder's loop — discovery, commitment, build, adoption — executed end to end under weekly public deadlines. Chhavi led a team of students from IIT Kanpur through the complete founder's loop — from open-ended discovery to a locked merchant problem to a shipped, adopted product — under weekly public deadlines. Her defining strength across this programme was intellectual honesty: owning assumptions, naming failures, and correcting course on evidence.

Programmes teach skills; finishing this one demonstrates temperament — the persistence to clear eight consecutive weekly gates, and the ownership to make something real work for a real business.
